Bees are flying insects. Types of bees are honeybees, bumblebees and sweat bees. Bees are found in every habitat that has flowering plants.

Bees fly from flower to flower sipping nectar and collecting grains of pollen. Bees have a long proboscis (type of tongue) that helps them to get the nectar out of flowers. Honeybees live in colonies or hives of honeycomb. All of the bees work together for the good of the hive.

Bees play a very important role in pollinating flowering plants. They have fuzzy bodies that allows the pollen to stick to the bees. They are the only insects that make food people can eat.

Bumblebees make only a tiny bit of honey, but farmers like them because they pollinate crops so fruit grows. Bumblebees live underground.
