Using the information on page 2, write a fact in each web circle.

The Arctic Wolf lives in the most northern part of the Arctic Circle. Due to the extreme cold they have two layers of thick fur and smaller ears than most wolves that regulate their body temperature. They also have padded paws that help them walk on the frozen ground. They are found in small groups with one male and one female together with their pups. Arctic wolves travel in 2 – 20 packs. They live 7-10 years in the wild.

Arctic wolves hunt lemmings, rodents, Arctic hare and musk ox. They work in teams to hunt larger prey such as the caribou.
