A beautiful butterfly flutters about when the shell opens. What comes out?

The form of the caterpillar now is gone. Inside the shell, a change was going on.

Then the shell cracks, and the parts inside make a shell where it hangs inside.

The caterpillar climbs on a leaf or twig. After growing nice and big, its skin gets too tight.

The caterpillar first is rather thin. But then, it eats till it bursts through its skin. Out pops a caterpillar, crawling on its legs.

A mama butterfly lays all her eggs. From eggs to butterfly, the life cycle begins.

Birth of a Butterfly
