Using the information on page 2, write a fact in each web circle about caribou. 

Caribou are found in the very coldest parts of North America, Asia, and Europe. Caribou that are domesticated are called reindeer and are used to pull sleds with heavy loads. Caribou are herbivores. They mostly eat lichen that is a moss that grows on the ground. They travel or migrate together to look for food. These herds can range from 1,000-10,000 caribou! They use their hooves to dig for food. Caribou have large circular hooves that help them walk in the snow. They are mammals with thick layers of fur that keep them warm and repel water. 

Caribou are fast runners and can run up to 50 miles per hour!
