All About Groundhogs

BY

________________________

________________________
The groundhog is another name for woodchuck. They are rodents and are the largest animal in the squirrel family. These solitary mammals sleep through the winter or hibernate in burrows. They dig their burrows and tunnels underground. Groundhogs are found in North America in forests and fields.

Groundhogs are mostly herbivores and eat plants. They eat grass, seeds, leaves, flowers and fruits. Sometimes they will eat eggs, small animals or insects. They eat as much as they can to fatten up before hibernating for the winter. They usually hibernate from October to March.

Groundhogs are famous for predicting spring. We celebrate Groundhog Day on February 2.

1. What does hibernate mean?

2. Groundhogs live in North America in ________________

3. They eat ________________
   ________________

4. They are famous for ________________

   They usually hibernate from October to March.
